TASK 10 / 25

Deep Specialist · Expert

Sprint B - Growth & Experimentation · Mastery 75%

Focus

Read out the first growth experiments and hold the line on honest conclusions.

What to build / complete

- Rigorous readouts of the live experiments (effect, CI, guardrails, SRM)
- Clear ship/no-ship recommendations with reasoning
- A documented log of experiments and what was learned

Execution — work through in order

Phase 3 gives you a goal and a bar, not a recipe. These stages are the discipline; the design decisions are yours to make and defend.

Stage A — Understand & set the bar

1. Re-read the Expected Output and the scoring parameters so you build to the bar, not past it.
2. Confirm every prerequisite and upstream input is actually in your hands, not merely promised.
3. Restate, in one sentence, what 'good' means here: Decisions get made on evidence, including the unpopular decision to kill a favourite feature.

Stage B — Build: Rigorous readouts of the live experiments (effect, CI, guardrails, SRM)

1. Define the metric, its source & the decision

Define precisely what “Rigorous readouts of the live experiments (effect, CI, guardrails, SRM)” measures, which raw events it depends on, and which decision it changes. No decision, no metric.

2. Build the query/model on real data

Build the query/model on real production data — sampled if you must, but never synthetic.

3. Validate: reconcile, sanity-check, quantify uncertainty

Reconcile against a source system, sanity-check the magnitude, and state the uncertainty honestly.

4. Tie every number to an action & defend it

For every number, be ready to say where it came from and what action it triggers. Undefendable numbers do not ship.

Stage C — Build: Clear ship/no-ship recommendations with reasoning

1. Define the metric, its source & the decision

Define precisely what “Clear ship/no-ship recommendations with reasoning” measures, which raw events it depends on, and which decision it changes. No decision, no metric.

2. Build the query/model on real data

Build the query/model on real production data — sampled if you must, but never synthetic.

3. Validate: reconcile, sanity-check, quantify uncertainty

Reconcile against a source system, sanity-check the magnitude, and state the uncertainty honestly.

4. Tie every number to an action & defend it

For every number, be ready to say where it came from and what action it triggers. Undefendable numbers do not ship.

Stage D — Build: A documented log of experiments and what was learned

1. Define the metric, its source & the decision

Define precisely what “A documented log of experiments and what was learned” measures, which raw events it depends on, and which decision it changes. No decision, no metric.

2. Build the query/model on real data

Build the query/model on real production data — sampled if you must, but never synthetic.

3. Validate: reconcile, sanity-check, quantify uncertainty

Reconcile against a source system, sanity-check the magnitude, and state the uncertainty honestly.

4. Tie every number to an action & defend it

For every number, be ready to say where it came from and what action it triggers. Undefendable numbers do not ship.

Stage E — Integrate, verify & make demoable

1. Wire your work into the end-to-end flow and run the whole journey once, start to finish.
2. Present a readout including at least one honest negative or inconclusive result.
3. Break it on purpose: force the failure path and confirm it degrades the way you designed.
4. Prepare a live demo on real data. Not slides, not screenshots, not 'it works on my machine'.

Done when (demoable by end of task)

- “Rigorous readouts of the live experiments (effect, CI, guardrails, SRM)” is complete, real, and demoable end-to-end.
- “Clear ship/no-ship recommendations with reasoning” is complete, real, and demoable end-to-end.
- “A documented log of experiments and what was learned” is complete, real, and demoable end-to-end.
- Good looks like: Decisions get made on evidence, including the unpopular decision to kill a favourite feature.

Worry if any of these are true

- Reporting a winner that came from peeking or a secondary metric.
- Guardrail regressions omitted from the readout.
- Calling an experiment early because it looked good on day two.

Hand-off

- Experiment verdicts to leadership. Make sure the next person can pick it up without you.
